

# HL7 CDA to FHIR mapping hands-on

16.6.2022, workshop with HL7 Italy, Via Alessandria, 220, 00198 Roma RM, Italien

# Agenda

- |               |  |
|---------------|--|
| 10.00 – 10.30 | High Level Introduction CDA and FHIR Mapping (Differences between Standards, FHIR Mapping Language as independent Mapping Exchange format) |
| 10.30 – 11.00 | FHIR Logical Model of CDA - Exercise   |
| 11.15 – 12.15 | FHIR Mapping Language Introduction with conversion to StructureMap - Exercise  |
| 14.00 – 15.00 | CDA to FHIR mapping hands-on with matchbox - Exercise (based on provided Italian example)  |
| 15.00 – 15.30 | Summary, Questions and answers - Exercise  |

IHE Suisse Member since 2015

IHE International ITI Technical Committee Co-Chair

### Dipl. Inf. ETH, ETH Zürich, 1996

IHE XDS Advanced Training, 2015  
Certified HL7 CDA Specialist, 2015  
Certified Scrum Master, 2014  
NDK eHealthcare, Nottwil, 2009

## **offering**

- **Consulting and Teaching** in eHealth topics from HL7 (FHIR, V2, CDA), IHE and Swiss EPR
- **Design and Architecture** of eHealth Information systems: API's, Exchange formats, Architecture, Hosting, Security
- **Implementation** Coordination and Integration of eHealth Software-Projects, PoC

## Workshop Übungen Computer Setup

- Editor: Visual Studio Code
  - REST Client Extension
  - fhir-tools Extension
  - FHIR Mapping Language Extension
- Github Desktop or git client locally
- Java Runtime for running HL7 Java Validator
- Docker

## Setting up Visual Studio Code

Getting up and running with Visual Studio Code is quick and easy. It is a small download so you can install in a matter of minutes and give VS Code a try.

### Cross platform

VS Code is a free code editor, which runs on the macOS, Linux, and Windows operating systems.

Follow the platform-specific guides below:

- macOS
- Linux
- Windows

VS Code is lightweight and should run on most available hardware and platform versions. You can review the [System Requirements](#) to check if your computer configuration is supported.

### Update cadence

VS Code releases a new version [each month](#) with new features and important bug fixes. Most platforms support auto updating and you will be prompted to install the new release when it becomes available. You can also manually check for updates by running [Help > Check for Updates](#) on Linux and Windows or running [Code > Check for Updates](#) on macOS.

# FHIR tools

Visual Studio Code Extension

A screenshot of the Visual Studio Code Extensions Marketplace. A large blue arrow points from the title "FHIR tools" and subtitle "Visual Studio Code Extension" on the left towards the extension's page in the marketplace. The marketplace page shows the "FHIR tools" extension by Yannick Lagger, version 1.3.0, with 261 installs and a 5-star rating. The page includes a preview image of a flame, a description, and tabs for Details, Feature Contributions, and Changelog. Below the marketplace page, a screenshot of the VS Code interface shows the FHIR tools extension in action, displaying XML code and context menu options like "Convert XML FHIR resource to JSON".

Extension: FHIR tools — cda-core-2.0

FHIR tools

**FHIR tools** 1.3.0  
Yannick Lagger

React Native Tools 0.16.0  
Debugging and integrated commands for React Native  
Microsoft

XML Tools 2.5.0  
XML Formatting, XQuery, and XPath Tools for Visual Studio Code  
Josh Johnson

Tools 0.1.2  
private tools  
vsQuicker

CMake Tools 1.4.0  
Extended CMake support in Visual Studio Code  
Microsoft

Spring Boot Tools 1.17.0  
Provides validation and content assist for Spring Boot® application  
Pivotal

Cordova Tools 1.9.4  
Code-hinting, debugging and integrated commands for Apache Cordova  
Microsoft

SQLTools - Database tools 0.21.7  
Database management done right. Connection explorer, query editor, schema browser  
Matheus Teixeira

Azure Resource Manager (ARM) Tools 0.10.0  
Language server, editing tools and snippets for Azure Resource Manager  
Microsoft

Unity Tools 1.2.3  
Various tools to help with Unity development  
Tobias Zarlez

Azure CLI Tools 0.5.0  
Tools for developing and running commands of the Azure CLI  
Microsoft

JSON Tools 1.0.2  
Tools for manipulating JSON  
Erik Lynd

## vscode-fhir-tools

Vscode-fhir-tools is an open-source extension for [Visual Studio Code](#) that implements some tools for the FHIR® standard created by Yannick Lagger. This project is not affiliated with, or approved or sponsored by, HL7.

FHIR® is the registered trademark of HL7 and is used with the permission of HL7. Use of the FHIR trademark does not constitute endorsement of this product by HL7.

See the [release notes](#) for the full set of changes

### Features

Convert XML FHIR resource to JSON

```
<?xml version="1.0" encoding="UTF-8"?>
<Patient xmlns="http://hl7.org/fhir">
  <id value="example"/>
  <text>
    <status val="example"/>
    <div xmlns="http://hl7.org/fhir">
      <table>
        <tr>
          <td>example</td>
          <td>example</td>
        </tr>
      </table>
    </div>
  </text>
</Patient>
```

# Java

The screenshot shows the official Java website. At the top, there's a red header bar with the Java logo on the left, a search bar with a magnifying glass icon on the right, and navigation links for "Download" and "Hilfe" in the center. Below the header, the main content area has a white background. On the left, a sidebar titled "HILFERESSOURCEN" contains a list of links: "Java installieren", "Java deaktivieren", "Java verwenden", "Allgemeine Fragen", "Mobile Java", "Sicherheit", and "Support-Optionen". To the right of the sidebar, the main content area features a section titled "Wie installiere ich Java?". It includes a sub-section "Download und Installation unter Windows" with text about getting Java for Windows and two bullet points: "Onlinedownload" and "Offlinedownload". There's also a printer icon in the top right corner of the main content area.

## Get Docker

 Update to the Docker Desktop terms

Commercial use of Docker Desktop in larger enterprises (more than 250 employees OR more than \$10 million USD in annual revenue) now requires a paid subscription.

Docker is an open platform for developing, shipping, and running applications. Docker enables you to separate your applications from your infrastructure so you can deliver software quickly. With Docker, you can manage your infrastructure in the same ways you manage your applications. By taking advantage of Docker's methodologies for shipping, testing, and deploying code quickly, you can significantly reduce the delay between writing code and running it in production.

You can download and install Docker on multiple platforms. Refer to the following section and choose the best installation path for you.

Docker Desktop for Mac

A native application using the macOS sandbox security model which delivers all Docker tools to your Mac.

Docker Desktop for Windows

A native Windows application which delivers all Docker tools to your Windows computer.

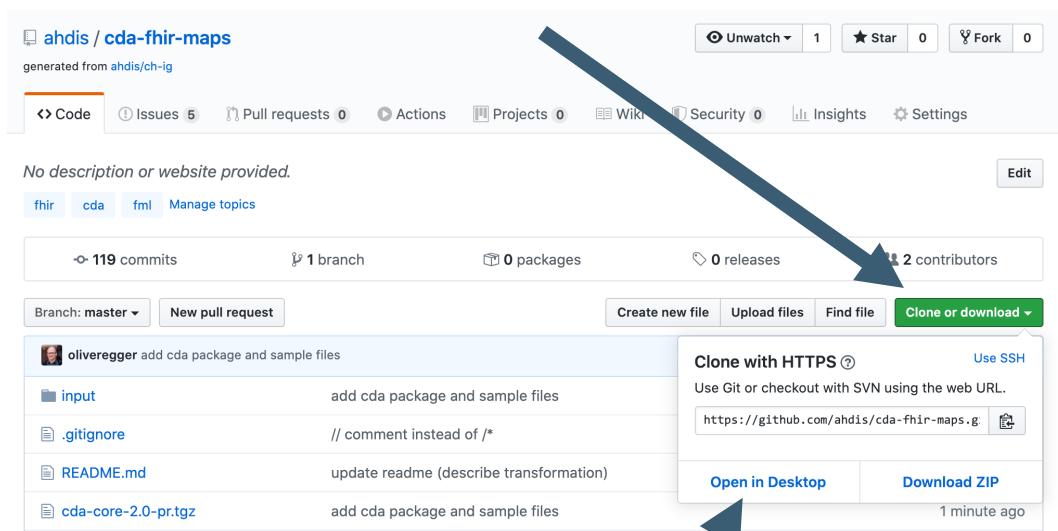

Docker Desktop for Linux

A native Linux application which delivers all Docker tools to your Linux computer.

## CDA section components, entry and reference to narrative

# FHIR documents

The screenshot shows the HL7 FHIR Release 4 homepage. At the top, there's a navigation bar with links: Home, Getting Started, Documentation, Resources, Profiles, Extensions, Operations, and Terminologies. To the right of the navigation bar is the HL7 International logo. Below the navigation bar, the word "Home" is displayed. A yellow banner at the top of the main content area states: "This page is part of the FHIR Specification (v4.0.1: R4 - Mixed Normative and STU). This is the current published version. For a full list of available versions, see the [Directory of published versions](#)". The main content starts with a section titled "0 Welcome to FHIR®". It includes a "First time here?" box with links to executive summary, developer's introduction, clinical introduction, architect's introduction, overview / roadmap & Timelines, open license, Table of Contents, and Community Credits. Below this is a "Technical Corrections:" section with a link to "4.0.1, Oct-30 2019". The page then transitions into a diagram illustrating the FHIR specification structure:

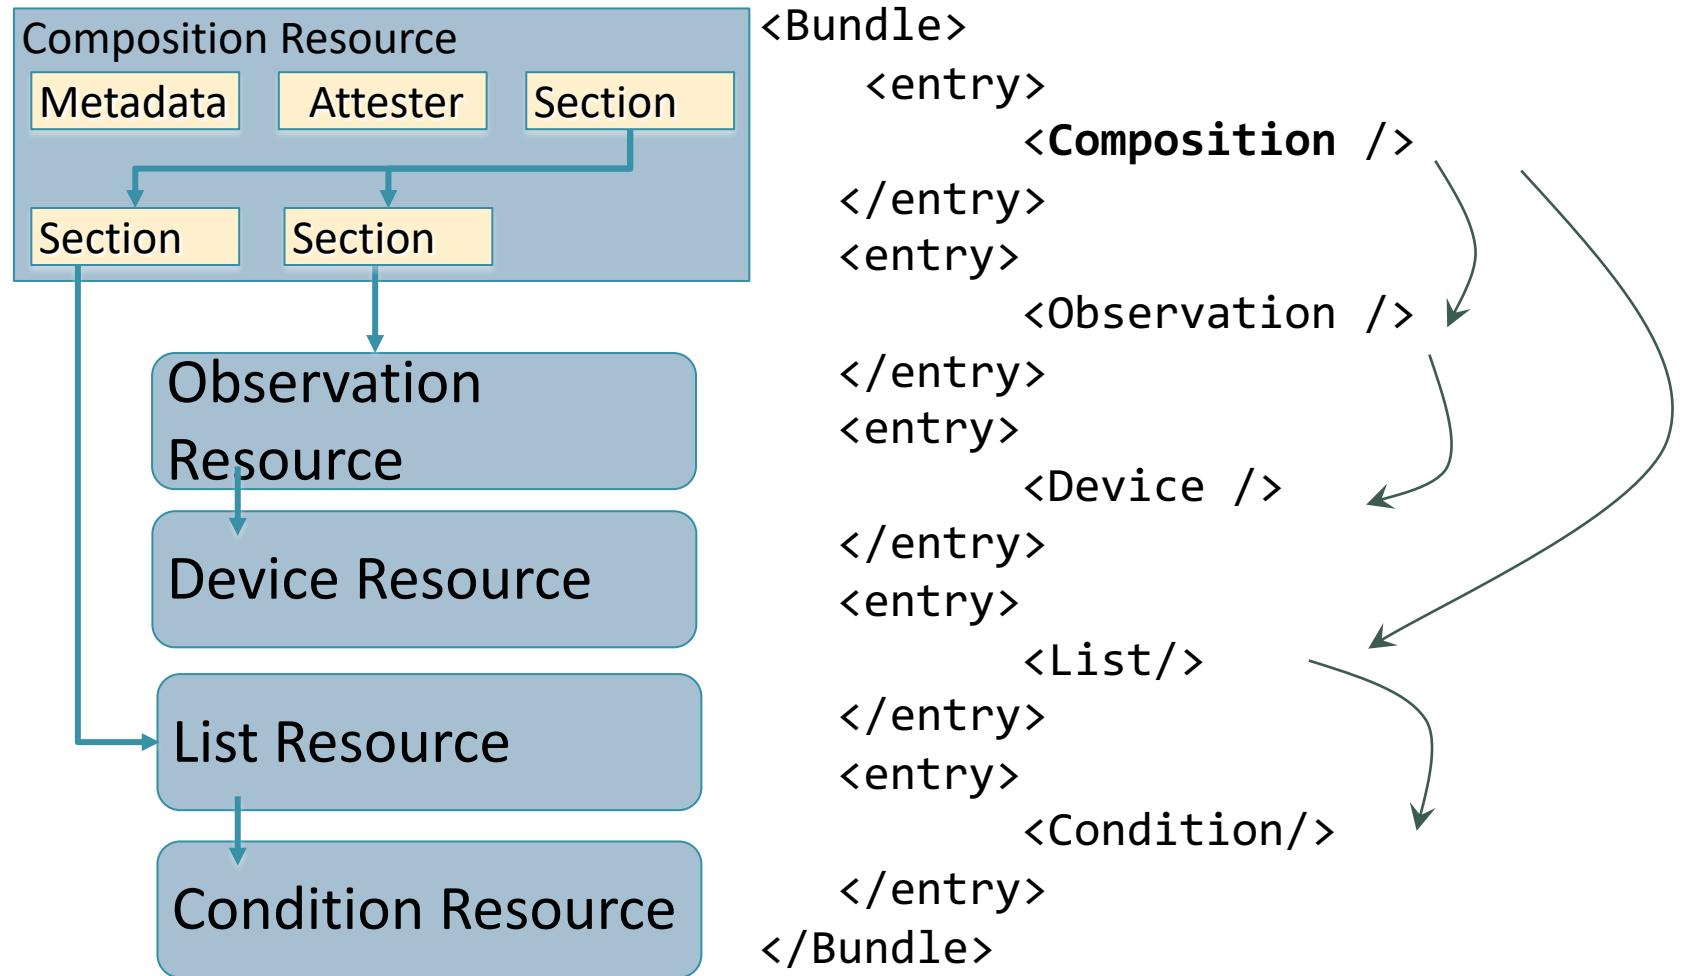

- Level 1:** Basic framework on which the specification is built.
  - Foundation:** Base Documentation, XML, JSON, Data Types, Extensions.
- Level 2:** Supporting implementation and binding to external specifications.
  - Implementer Support:** Downloads, Version Mgmt, Use Cases, Testing.
  - Security & Privacy:** Security, Consent, Provenance, AuditEvent.
  - Conformance:** StructureDefinition, CapabilityStatement, ImplementationGuide, Profiling.
  - Terminology:** CodeSystem, ValueSet, ConceptMap, Terminology Svc.
  - Exchange:** REST API + Search Documents, Messaging Services, Databases.

<http://www.hl7.org/fhir/>

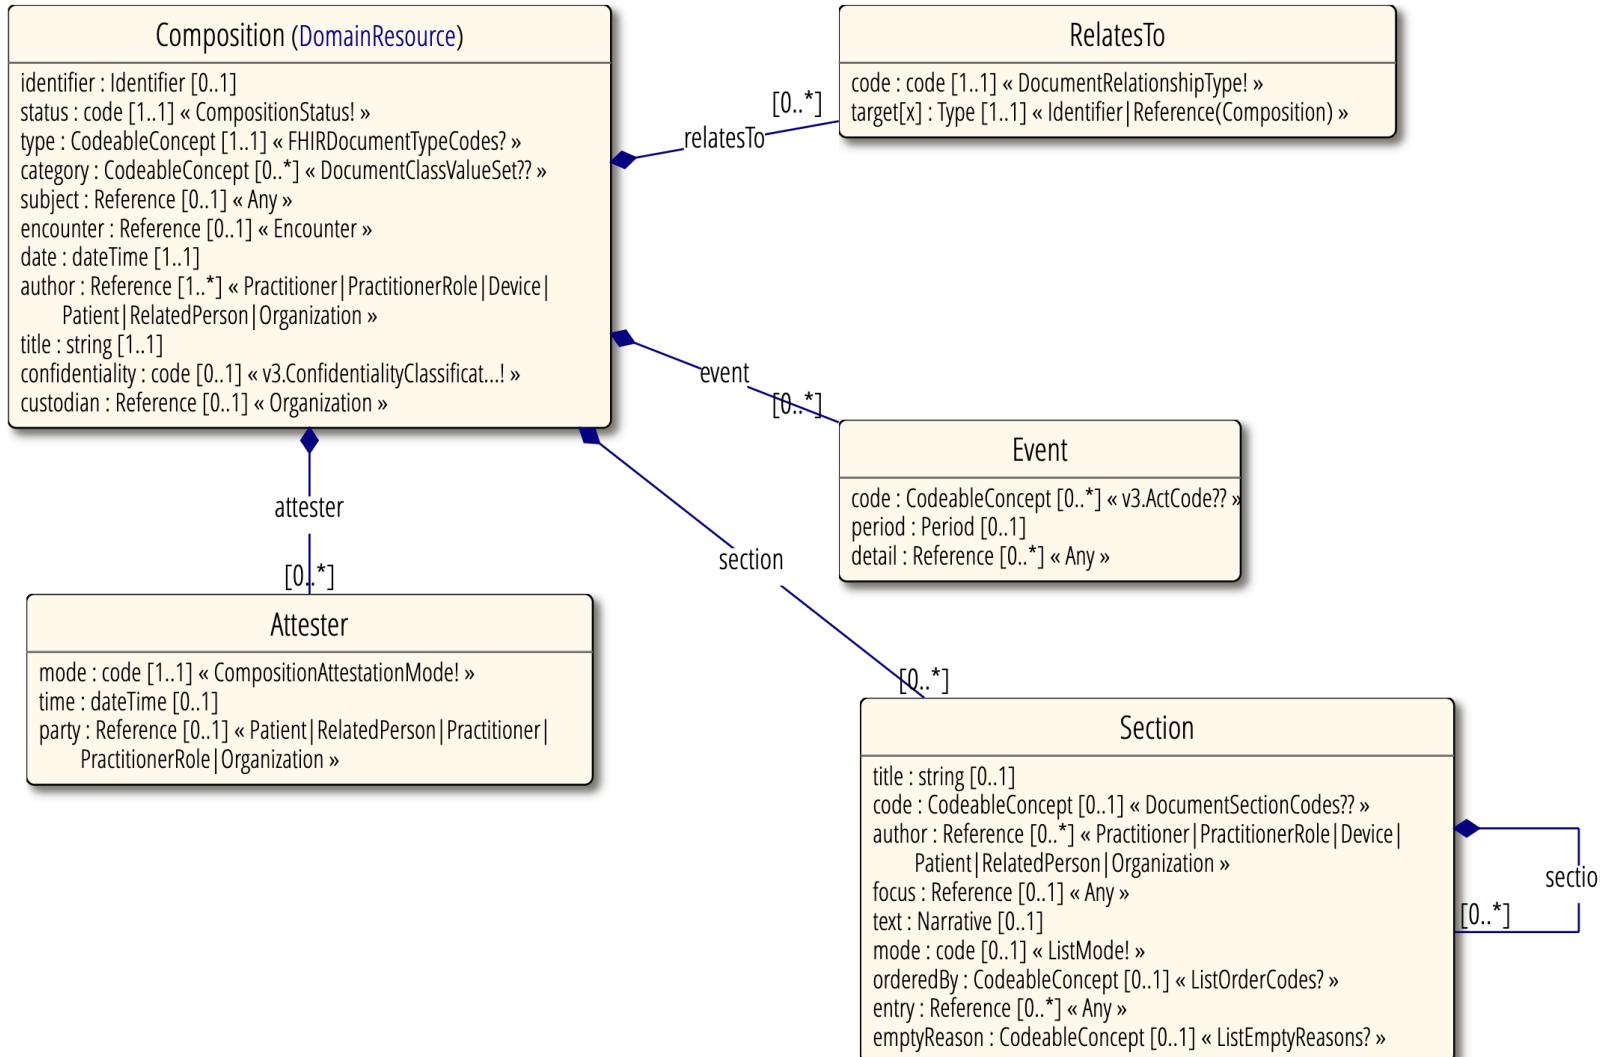

## FHIR documents

- FHIR resources can be used to build documents that represent a composition: a coherent set of information that is a statement of healthcare information.
- First entry is a Composition Resource
  - Equivalent to CDA header and narrative
  - Can be signed, authenticated, etc.
  - A FHIR document has the same basic principles as a CDA document

## Documents are Bundles

# Composition Resource

# Composition CDA Mapping

The screenshot shows the HL7 FHIR website interface. At the top, there is a navigation bar with links: Home, Getting Started, Documentation, Resources, Profiles, Extensions, Operations, and Terminologies. Below the navigation bar, a breadcrumb trail indicates the current location: Foundation > Composition > Mappings. A yellow banner at the top of the main content area states: "This page is part of the FHIR Specification (v4.0.1: R4 - Mixed Normative and STU). This is the current published version. For a full list of available versions, see the [Directory of published versions](#)". Below the banner, there is a horizontal navigation bar with links: Content, Examples, Detailed Descriptions, **Mappings**, Profiles & Extensions, Operations, and R3 Conversions. The **Mappings** link is highlighted with a red border. The main content area features a section titled "2.41.10 Resource Composition - Mappings". Below this title is a table with the following data:

Structured Documents	Work Group	Maturity Level: N/A	Standards Status: Informative	Security Category: Not Classified	Compartments: Device, Encounter, Patient, Practitioner, RelatedPerson
----------------------	------------	---------------------	-------------------------------	-----------------------------------	---

Below the table, there is a section titled "2.41.10.3 CDA (R2) (<http://hl7.org/v3/cda>)" which contains a table mapping fields from the Composition resource to ClinicalDocument fields. The table has two columns:

Composition	ClinicalDocument
(meta.profile)	ClinicalDocument.templateId
(language)	ClinicalDocument.languageCode
identifier	.setId
status	n/a
type	.code
category	n/a
subject	.recordTarget
encounter	componentOf.encompassingEncounter

At the bottom right of the page, there is a link: <http://hl7.org/fhir/composition-mappings.html>.

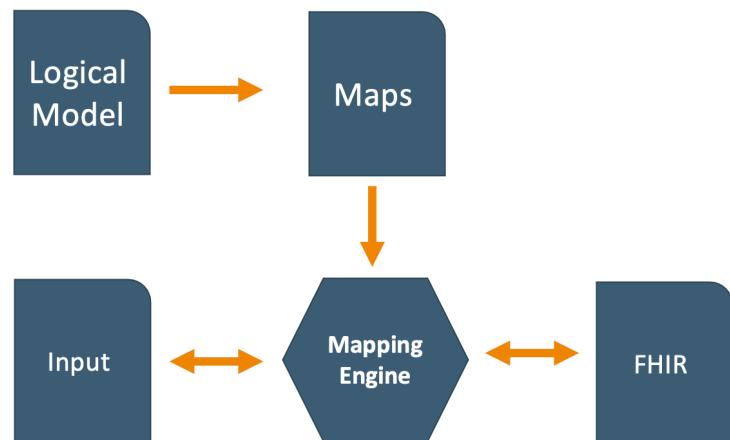

## Mapping from CDA to FHIR

- CDA Level 1: (Just metadata and text), map to Bundle/Composition
  - CDA Level 2: Coded sections, map to Bundle/Composition
  - CDA Level 3: Structured entries, map to entries in Bundle
- Level 1, Level 2 can be done maybe 70% generic, there are some different or missing concepts or too general to map
- Level 3 general mapping hardly possible, can only be done on a profiled CDA (template), like C-CDA or a specific exchange format

*Mappings should be done at the CDA template level rather than at the CDA specification*

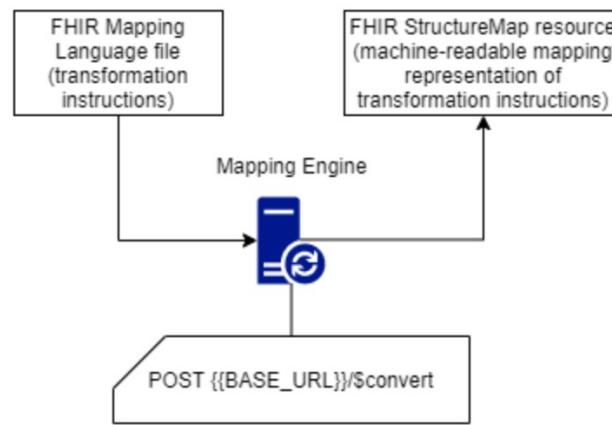

## FHIR Mapping Language

<https://www.hl7.org/fhir/mapping-language.html>

The mapping language describes how one set of Directed Acyclic Graphs (an instance) is transformed to another set of directed acyclic graphs. It is not necessary for the instances to have formal declarations and/or be strongly typed - just that they have named children that themselves have properties.

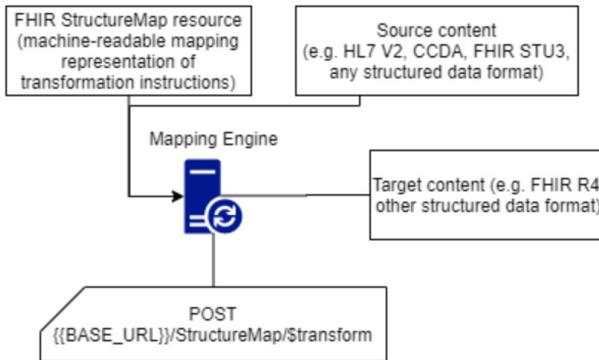

## Mapping Authoring

- Define mapping instructions to transform the source content to the target content.
- Use the mapping engine to create a machine-readable representation of the mapping instructions in the form of a FHIR StructureMap resource.

```
// source: https://art-decor.org/art-decor/decor-templates--ch-pharm--?section=templates&id=2.16.756.5.30.1.1.10.4.45
// target: http://build.fhir.org/ig/hl7ch/ch-emed/branches/master/StructureDefinition-ch-emed-ext-treatmentplan.html
group: MTPReferenceEntryContentModule(source: entryrelationship, target: ext: Extension) {
  entryrelationship-> ext.url = 'http://fhir.ch/ig/ch-emed/StructureDefinition/ch-emed-ext-treatmentplan'."url";
  entryrelationship.substanceAdministration as substanceAdministration then {
    substanceAdministration.id as id -> ext.extension as ext then InnerExtensionId(id, ext)."innerExtensionId";
    substanceAdministration.reference as reference then {
      reference.externalDocument as externalDocument then {
        externalDocument.id as id -> ext.extension as ext then InnerExtensionExternalDocumentId(id, ext)."innerExtensionExternalDocumentId";
      }."externalDocument";
    }."substanceAdministration";
  }."id";
}
```

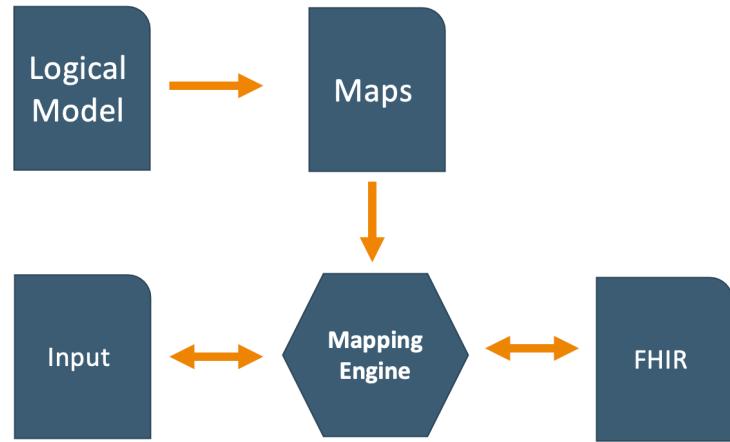

## Mapping Execution

- Store the source FHIR StructureMap resource on the FHIR Server.
- Execute transformations - `$transform` - The mapping engine requires:
  - The source content to transform.
  - The machine-readable representation of the mapping instructions previously created.
- Store the generated target content (optional)

<https://confluence.hl7.org/display/FHIR/Using+the+FHIR+Mapping+Language>

# Logical model

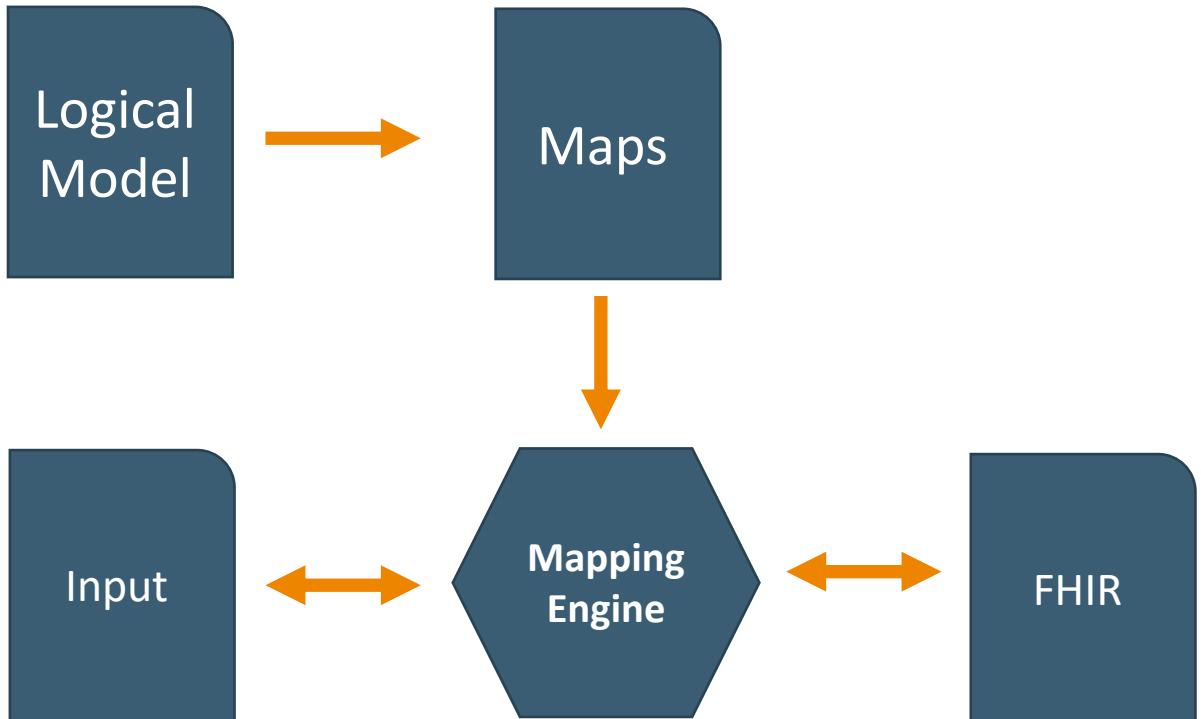

- ▶ Defining a content model to support the mapping language
- ▶ e.g. CDA Logical Model

<https://www.hl7.org/fhir/structureddefinition.html#logical>

## FHIR Mapping Language

- Custom data to FHIR
  - CDA to FHIR and back
  - Structured Data Capture: Questionnaire Response to Resources
- ✓ Mappings have a textual representation
- ✓ Aligned to FHIR: ConceptMap, FHIRPath
- ✓ Maps can be integrated and distributed with IG's
- Need to describe Logical Model (rarely Parser)
  - Steep Learning Curve for the Language
  - API of the FHIR Mapping Language
  - <https://www.hl7.org/fhir/mapping-language.html>

*Feedback, Questions?*

# Agenda

- |               |  |
|---------------|--|
| 10.00 – 10.30 | High Level Introduction CDA and FHIR Mapping (Differences between Standards, FHIR Mapping Language as independent Mapping Exchange format) |
| 10.30 – 11.00 | FHIR Logical Model of CDA - Exercise   |
| 11.15 – 12.15 | FHIR Mapping Language Introduction with conversion to StructureMap - Exercise  |
| 14.00 – 15.00 | CDA to FHIR mapping hands-on with matchbox - Exercise (based on provided Italian example)  |

# FHIR Logical model for CDA

## **FHIR Logical model CDA**

- Introduction FHIR Logical Model
- CDA logical Model – Implementation Guide
- FHIRPath
- Conversion CDA Narrative to xhtml

## StructureDefinition

- The **StructureDefinition** resource describes a structure - a set of data element definitions, and their associated rules of usage. These structure definitions are used to describe both the content defined in the FHIR specification itself - Resources, data types, the underlying infrastructural types, and also are used to describe how these structures are used in implementations.
- Note that as part of the specification itself, a full set of structure definitions for all resources and data types is published.

<http://hl7.org/fhir/structuredefinition.html>

# StructureDefinition

      </slicing>
    </element>
  </differential>
```

## **Logical models based on StructureDefinitions**

- StructureDefinitions can also be used to define any arbitrary structures that are a directed acyclic graph with typed nodes, where the primitive types are those defined by the FHIR specification.
- This technique has many uses
  - Describing any arbitrary content model
  - Describing existing HL7 content models (e.g. v2, CDA) using FHIR
  - Describing common design patterns used in FHIR
  - Defining a content model to support the mapping language

<http://hl7.org/fhir/structuredefinition.html#logical>

# StructureDefinition

- [PQ: PhysicalQuantity](#)

## **V3 Datatypes**

AD: PostalAddress

ANY: DataValue

BL: Boolean

CD: ConceptDescriptor

CE: CodedWithEquivalents

CO: CodedOrdinal

CR: ConceptRole

CS: CodedSimpleValue

CV: CodedValue

ED: EncapsulatedData

EIVL\_TS:  
EventRelatedPeriodicInterval

EN: EntityName

EN: EntityName

II: InstanceIdentifier

INT: IntegerNumber

IVL\_INT: Interval

IVL\_PQ: Interval

IVL\_TS: Interval

MO: MonetaryAmount

PIVL\_TS: PeriodicIntervalOfTime

PQ: PhysicalQuantity

PQR: PhysicalQuantityRepresentation

QTY: Quantity

REAL: RealNumber

RTO\_PQ\_PQ: Ratio

SC: CharacterStringWithCode

ST: CharacterString

SXCM\_TS: GeneralTimingSpecification

SXPR\_TS: Component part of GTS

TEL: TelecommunicationAddress

TS: PointInTime

## CDA & FHIR Logical Model

- attributes
- type attributes in xml
- text in xml elements
- CDA narrative vs xhtml
- V3 classes with id element and extension attribute
- foreign namespaces
- choice elements from CDA schema
- granularity of model (e.g. EntryRelationship as Element and not as only type)

# cda xml attributes

```
<telecom use="HP"  
         value="tel:+41.32.685.12.34"/>
```

validator: internal conversion

## V3 classes with id element and extension attribute

```
<id root="31397B31-BE60-47E1-BEC6-F37816D42B0C"/>  
  
<id extension="7601000201041" root="2.51.1.3"/>  
  
<element id="ClinicalDocument.id">  
  <path value="ClinicalDocument.id"/>  
  <min value="1"/>  
  <max value="1"/>  
  <type>  
    <code value="http://hl7.org/fhir/cda/StructureDefinition/II"/>  
  </type>  
</element>
```

```
<element id="II.extension">  
  <path value="II.extension"/>  
  <representation value="xmlAttr"/>  
  <label value="Extension"/>  
  <definition  
    value="A character string as a unique identifier wi  
  <min value="0"/>  
  <max value="1"/>  
  <type>  
    <code value="string"/>  
  </type>  
</element>
```

Name	Flags	Card.	Type	Description & Constraints	?
Element	I	n/a		Base for all elements <i>All FHIR elements must have a @value or children</i>	
id		0..1	string	Unique id for inter-element referencing	
extension		0..*	Extension	Additional content defined by implementations	

V3 classes are now derived from Base (not Element anymore), but Base is a R5 type <http://build.fhir.org/types.html#Base>

## CDA & FHIR Logical Model Demonstration

- For this demonstration the FHIR Logical model for CDA has been forked. The generated IG can be found here:  
<https://github.com/ahdis/cda-core-2.0/releases> and is provided in  
<https://github.com/hl7ch/cda-fhir-maps/cda-core-2.0-pr.tgz>

## CDA and FHIR Validator

The HL7 FHIR Validator can validate also models, you need to provide the packagename (cda-core-2.0-pr.tgz instead of hl7.fhir.cda#current)

```
java -jar /Users/oliveregger/.vscode/extensions/yannick-lagger.vscode-fhir-tools-1.5.0/validator_cli.jar ./input/cda-it/CDA2_Referto_di_Medicina_di_Laboratorio.xml -version 4.0.1 -ig cda-core-2.0-pr.tgz
```

```
Internal error in location for message: 'Error @1, 1: Found / expecting a token name', loc = '/v3:ClinicalDocument/v3:participant/v3:associatedEntity', err = 'Undefined attribute @nullFlavor' on associatedEntity for type http://hl7.org/fhir/cda/StructureDefinition/AssociatedEntity (properties = [AssociatedEntity.classCode, AssociatedEntity.templateId, AssociatedEntity.id, AssociatedEntity.code, AssociatedEntity.addr, AssociatedEntity.telecom, AssociatedEntity.associatedPerson, AssociatedEntity.scopingOrganization])'
```

```
Internal error in location for message: 'Error @1, 1: Found / expecting a token name', loc = '/v3:ClinicalDocument/v3:documentationOf/v3:serviceEvent', err = 'Undefined element statusCode'
```

00:02.0293

Done. Times: Loading: 00:10.0139, validation: 00:02.0294. Memory = 294Mb

\*FAILURE\*: 9 errors, 0 warnings, 0 notes

## CDA and FHIR Validator

- CDA V3 Code validation is not supported with the validator
- Last Error seems a CDA Logical Model Problem

```
Error @ ClinicalDocument.author[0].assignedAuthor.classCode (line 55, col40): The value provided ('ASSIGNED') is not in the value set 'RoleClassAssignedEntity' (http://terminology.hl7.org/ValueSet/v3-RoleClassAssignedEntity), and a code is required from this value set) (error message = The code system '' is not known (encountered paired with code = 'ASSIGNED')); The code provided (#ASSIGNED) is not valid in the value set 'RoleClassAssignedEntity' (from http://tx.fhir.org/r4)

## Applying FHIRPath expressions to CDA documents

- [FHIRPath](#) is a path based navigation and extraction language, somewhat like XPath.
- Operations are expressed in terms of the logical content of hierarchical data models, and support traversal, selection and filtering of data.
- Its design was influenced by the needs for path navigation, selection and formulation of invariants in both HL7 Fast Healthcare Interoperability Resources ([FHIR](#)) and HL7 Clinical Quality Language ([CQL](#)).

## FHIRPath examples

- Patient.name.given
- Patient.telecom.where(use = 'official')
- Patient.name[0]

<http://hl7.org/fhirpath/>

<https://www.hl7.org/fhir/fhirpath.html>

# Applying FHIRPath expressions to CDA documents

```
<recordTarget>
  <patientRole>
    <id extension="12345" root="2.16.840.1.113883.19.5"/>
    <patient>
      <name>
        <given>Henry</given>
        <family>Levin</family>
        <suffix>the 7th</suffix>
      </name>
      <administrativeGenderCode code="M" codeSystem="2.16.840.1.113883.19.5"/>
      <birthTime value="19320924"/>
```

```
java -jar org.hl7.fhir.validator.jar
      -version 4.0.1 -ig cda-core-2.0-pr.tgz
      -fhirpath
recordTarget.patientRole.patient.name.given.dataString
input/cda/cda-original.xml
.. definitions from hl7.fhir.r4.core#4.0.1 (v4.0.1)
... evaluating
recordTarget.patientRole.patient.name.given.dataString
Henry
```

## **Summary CDA Logical Model**

- Logical Model is a description of CDA
  - no API
  - datatypes are equivalent to FHIR
  - no FHIR resources
  - no query possibilities
- Logical Model can be used with the FHIR Mapping Language

## Exercise

- Use the Java Validator to
  - validate the CDA File in ./input/cda-it/CDA2\_Referto\_Radiologia.xml
  - develop a FHIRPath expression to get the family name of the recordTarget

*Feedback, Questions?*

# FHIR Mapping Language

## FHIR Mapping Language

The mapping language describes how one set of Directed Acyclic Graphs (an instance) is transformed to another set of directed acyclic graphs. It is not necessary for the instances to have formal declarations and/or be strongly typed - just that they have named children that themselves have properties.

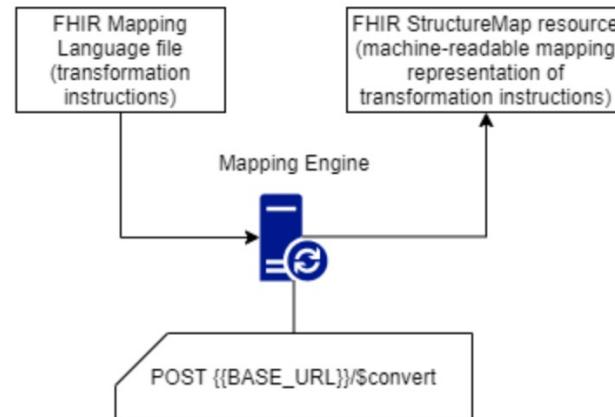

<https://www.hl7.org/fhir/mapping-language.html>

## FHIR Mapping Language

<https://www.hl7.org/fhir/mapping-language.html>

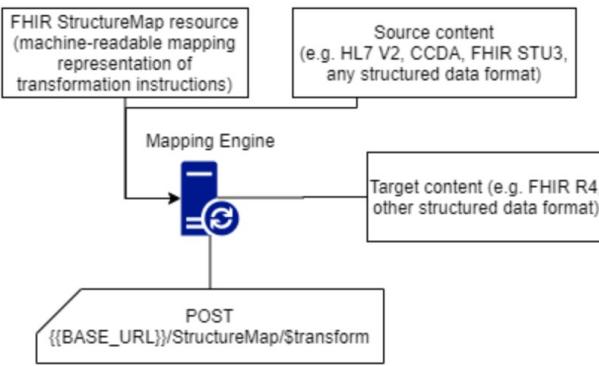

## Mapping Authoring

- Define mapping instructions to transform the source content to the target content.
- Use the mapping engine to create a machine-readable representation of the mapping instructions in the form of a FHIR StructureMap resource.

<https://confluence.hl7.org/display/FHIR/Using+the+FHIR+Mapping+Language>

## Mapping Execution

- Store the source FHIR StructureMap resource on the FHIR Server.
- Execute transformations - `$transform` - The mapping engine requires:
  - The source content to transform.
  - The machine-readable representation of the mapping instructions previously created.
- Store the generated target content (optional)

<https://confluence.hl7.org/display/FHIR/Using+the+FHIR+Mapping+Language>

## Mapping Engines

- Java FHIR Mapping
  - Java Validator
  - matchbox (hapi-fhir, java, test.ahdis.ch/matchbox)

<https://confluence.hl7.org/display/FHIR/Using+the+FHIR+Mapping+Language>

# FHIR Mapping Language

The screenshot shows the HL7 FHIR website for Release 4. The header includes the HL7 FHIR logo and navigation links for Home, Getting Started, Documentation, Resources, Profiles, Extensions, Operations, and Terminologies. A search icon and the HL7 International logo are also present. The main content area is titled "Implementation Support > Mapping Language". A yellow banner at the top of the content area states: "This page is part of the FHIR Specification (v4.0.1: R4 - Mixed Normative and STU). This is the current published version. For a full list of available versions, see the [Directory of published versions](#)". Below this, a section titled "7.7.0 FHIR Mapping Language" is shown. It includes a table with three columns: "FHIR Infrastructure Work Group", "Maturity Level: 0 (Draft)", and "Standards Status: Trial Use". The text explains that the specification includes a mapping language with a concrete syntax defined in this page and an abstract syntax in the StructureMap resource. It also notes that the mapping language describes how instances are transformed between different structures. A list of parts for a map is provided, including Metadata, ConceptMaps, References, Imports, groups, and transformation rules.

This page is part of the FHIR Specification (v4.0.1: R4 - Mixed Normative and STU). This is the current published version. For a full list of available versions, see the [Directory of published versions](#).

## 7.7.0 FHIR Mapping Language

FHIR Infrastructure Work Group	Maturity Level: 0 (Draft)	Standards Status: Trial Use
--------------------------------	---------------------------	-----------------------------

The FHIR Specification includes a mapping language. The mapping language has a concrete syntax, defined and described in this page, and an abstract syntax, which is found in the [StructureMap](#) resource. See also the [Tutorial](#).

The mapping language describes how one set of Directed Acyclic Graphs (an instance) is transformed to another set of directed acyclic graphs. It is not necessary for the instances to have formal declarations and/or be strongly typed - just that they have named children that themselves have properties. On the other hand, when the instances are strongly typed - specifically, when they have formal definitions that are represented as [Structure Definitions](#), the mapping language can use additional type related features.

The mapping language addresses two very different kinds of transformations:

- Structural changes between the source and target structures
- Differences in content and formats in string (and related) primitives contained within the structures

A map has 6 parts:

- Metadata
- Embedded [ConceptMaps](#) to translate between different code systems
- References to the structures involved in the mapping
- Imports: additional Maps used by this map
- A series of groups, each with a list of input variables
- A series of transformation rules in each group

<https://www.hl7.org/fhir/mapping-language.html>

# FHIR Mapping Language tutorial

The screenshot shows the HL7 FHIR Release 4 website. The header includes the HL7 FHIR logo and navigation links for Home, Getting Started, Documentation, Resources, Profiles, Extensions, Operations, and Terminologies. A search icon and the HL7 International logo are also present. The breadcrumb navigation shows Implementation Support > Mapping Language > Mapping Language Tutorial. A yellow banner at the top states: "This page is part of the FHIR Specification (v4.0.1: R4 - Mixed Normative and STU). This is the current published version. For a full list of available versions, see the [Directory of published versions](#)". The main content area is titled "7.7.1 FHIR Mapping Language - Tutorial". Below it, there are three status indicators: "FHIR Infrastructure Work Group", "Maturity Level: N/A", and "Standards Status: Informative". The text "This tutorial introduces the FHIR [mapping language](#)." is followed by "7.7.1.1 Step #1: Simplest possible transform". It describes mapping between two structures: "Source Structure" (TLeft, a : string [0..1]) and "Target Structure" (TRight, a : string [0..1]). It notes that the left instance is transformed to the right instance by copying 'a' to 'a'. A note states: "Note that for clarity in this tutorial, all the types are prefixed with T." The final paragraph explains the first task: setting up the mapping context on a default group, specifying source and target models, and applying a copy of the left instance to the right instance.

<https://www.hl7.org/fhir/mapping-tutorial.html>

## Step #1: Simplest possible transform

Source Structure	Target Structure
TLeft a : string [0..1]	TRight a : string [0..1]

The left instance is transformed to the right instance by copying a to a

```
1  ///·title = "tutorial-step1"
2  ///·status = draft
3
4  map ·http://hl7.org/fhir/StructureMap/tutorial-step1 ·= "tutorial-step1"
5
6  uses ·http://hl7.org/fhir/StructureDefinition/tutorial-left ·alias TLeft ·as ·source
7  uses ·http://hl7.org/fhir/StructureDefinition/tutorial-right ·alias TRight ·as ·target
8
9  group ·tutorial(source ·src ·: TLeft, target ·tgt ·: TRight) ·{
10    ...src.a ·as ·a -> tgt.a = a ·"rule_a";
11 }
```

<https://www.hl7.org/fhir/mapping-tutorial.html>

# HL7 FHIR Java Validator

Copy validator to step1 directory or adjust path

```
% java -jar validator_cli.jar ./source/source1.xml -transform http://hl7.org/fhir/StructureMap/tutorial -  
version 4.0.1 -ig ./logical -ig ./map -output ./output.xml  
FHIR Validation tool Version 5.6.43 (Git# 3ffffad10e36f). Built 2022-04-28T02:39:57.434Z (39 days old)

  <a value="step1"/>  
</TRight1>
```

<https://github.com/ahdis/fhir-mapping-tutorial/blob/master/step1/java.md>

# Step #1: Demo mit VS Code REST Client

The screenshot shows a VS Code interface with several panes:

- EXPLORER**: Shows a file tree with a folder named "FHIR-MAPPING-TUTORIAL". Inside "FHIR-MAPPING-TUTORIAL" are subfolders "maptutorial" and "step1", and files "source1.xml", "step1.map", "test.ahdis.ch.http", and "validator\_cli.jar".
- source1.xml**: A code editor showing XML content:

```
<TLeft1 xmlns="http://hl7.org/fhir/tutorial">
  <a value="step1" />
</TLeft1>
```
- step1.map**: A code editor showing a StructureMap file:

```
/// title = "tutorial-step1"
/// status = draft
map "http://hl7.org/fhir/StructureMap/tutorial-step1" = "tutorial-step1"
uses "http://hl7.org/fhir/StructureDefinition/tutorial-left1"
uses "http://hl7.org/fhir/StructureDefinition/tutorial-right1"
group tutorial(source src : TLeft1, target tgt : TRight1) {
  src.a as a -> tgt.a = a "rule_a";
}
```
- test.ahdis.ch.http**: A code editor showing a POST request to a FHIR endpoint:

```
POST {{host}}/matchbox/fhir/StructureMap/$transform?source=http://hl7.org/fhir/StructureMap/tutorial-step1
Accept: application/fhir+xml;fhirVersion=4.0
Content-Type: application/fhir+xml;fhirVersion=4.0
< ./source/source1.xml
### FHIR Tutorial do the transform
Send Request
POST {{host}}/matchbox/fhir/StructureMap/$transform?source=http://hl7.org/fhir/StructureMap/tutorial-step1
Accept: application/fhir+json;fhirVersion=4.0
Content-Type: application/fhir+json;fhirVersion=4.0
< ./source/source1.json
### Add Logical Model if not known FHIR Tutorial send StructureDefinition TLeft1
Send Request
POST {{host}}/matchbox/fhir/StructureDefinition HTTP/1.1
Accept: application/fhir+xml;fhirVersion=4.0
Content-Type: application/fhir+xml;fhirVersion=4.0
< LogicalDefinition.tleft1.xml
```
- Response(147ms)**: A code editor showing the response from the server:

```
HTTP/1.1 200
Content-Type: application/fhir+xml;charset=UTF-8
Transfer-Encoding: chunked
Date: Mon, 06 Jun 2022 20:16:26 GMT
Connection: close
<?xml version="1.0" encoding="UTF-8"?>
<TRight1
  xmlns="http://hl7.org/fhir/tutorial">
  <a value="step1"/>
</TRight1>
```

Two orange arrows point from the "test.ahdis.ch.http" code editor to the "source1.xml" and "step1.map" code editors, indicating the flow of data from the source files through the transformation logic.

clone <https://github.com/ahdis/fhir-mapping-tutorial>

<https://github.com/ahdis/fhir-mapping-tutorial/blob/master/maptutorial/step2/test.ahdis.ch.http>

## Step #2: Fields with different names

Source Structure	Target Structure
TLeft a1 : string [0..1]	TRight a2 : string [0..1]

The left instance is transformed to the right instance by copying a1 to a2

```
1  /// title = "tutorial-step2"
2  /// status = draft
3
4  map "http://hl7.org/fhir/StructureMap/tutorial-step2" = "tutorial-step2"
5
6  uses "http://hl7.org/fhir/StructureDefinition/tutorial-left" alias TLeft as source
7  uses "http://hl7.org/fhir/StructureDefinition/tutorial-right" alias TRight as target
8
9  group tutorial(source src : TLeft, target tgt : TRight) {
10    src.a1 as a -> tgt.a2 = a "rule_a";
11  }
12 }
```

<https://www.hl7.org/fhir/mapping-tutorial.html>

## Step #5: Managing lists, part 1

Source Structure	Target Structure
TLeft a22 : string [0..*]	TRight a22 : string [0..*]

The left instance is transformed to the right instance by copying a22 to a22, once for each copy of a22

```
1 /// title = "tutorial-step5"
2 /// status = draft
3
4 map "http://hl7.org/fhir/StructureMap/tutorial-step5" = "tutorial-step5"
5
6 uses "http://hl7.org/fhir/StructureDefinition/tutorial-left-5" as source
7 uses "http://hl7.org/fhir/StructureDefinition/tutorial-right-5" as target
8
9 group tutorial(source src : TLeft, target tgt : TRight) {
10   src.a22 as a -> tgt.a22 = a "rule_a22";
11 }
12
```

<https://www.hl7.org/fhir/mapping-tutorial.html>

## Step #6: Managing lists, part 2

Source Structure	Target Structure
TLeft a23 : string [0..*]	TRight a23 : integer [0..1]

The left instance is transformed to the right instance by copying a23 to a23, but there can only be one copy of a23

```
src.a23 as a -> tgt.a23 = a; // leave it to the transform engine
src.a23 only_one as a -> tgt.a23 = a; // transform engine throws an error if there is more than one
src.a23 first as a -> tgt.a23 = a; // Only use the first one
src.a23 last as a -> tgt.a23 = a; // Only use the last one
```

## Step #7: Simple Nesting

### Source Structure

```
TLeft  
aa : [0..*]  
ab : string [1..1]
```

### Target Structure

```
TRight  
aa : [0..*]  
ab : string [1..1]
```

```
src.aa as s_aa -> tgt.aa as t_aa then { // make aa exist  
    s_aa.ab as ab -> t_aa.ab = ab; // copy ab inside aa  
};
```

```
src.aa as s_aa -> tgt.aa as t_aa then ab_content(s_aa, t_aa); // make aa exist  
  
group ab_content(source src, target tgt) {  
    src.ab as ab -> tgt.ab = ab; // copy ab inside aa  
}
```

## Transform Rules

```
src_context.field as new_variable where condition  
-> tgt_context.field = create([type]) as new_variable  
    then [details] "name";  
  
src.value : code as vs0  
-> tgt.value = create("code") as vt0  
    then code(vs0, vt0) "valueCode";
```

# FHIR Mapping Example 1

## QuestResp.item.item.answer.valueString to Patient.gender

The screenshot shows a FHIR mapping interface with two main panels: qr.json and qr2patgender.map.

**qr.json (Left Panel):**

```
{} qr.json M ×  
qrpat > {} qr.json > [ ]item > {} 0 > [ ]item  
You, 24 seconds ago | 1 author (You)  
1 {  
2   "resourceType": "QuestionnaireResponse",  
3   "id": "grpatientsexeresponse",  
4   "questionnaire": "http://ahdis.ch/matchbox/fml/qrpatientsex",  
5   "status": "in-progress",  
6   "item": [  
7     {  
8       "linkId": "patient",  
9       "text": "Patient",  
10      "item": [  
11        {  
12          "linkId": "patient.sex",  
13          "text": "Geschlecht",  
14          "answer": [  
15            {  
16              "valueString": "male"  
17            }  
18          ]  
19        },  
20      ],  
21    },  
22  ],  
23}
```

A tree view on the right shows the structure of the JSON object, with nodes like item, linkId, definition, text, answer, value[x], and various value types (Boolean, Decimal, Integer, Date, DateTime, Time, Uri, Attachment, Coding, Quantity, Reference).

**qr2patgender.map (Right Panel):**

```
≡ qr2patgender.map M ×  
qrpat > map > ≡ qr2patgender.map  
You, 57 seconds ago | 1 author (You)  
1 map "http://ahdis.ch/matchbox/fml/qr2patgender" := "qr2patgender"  
2 |  
3 uses "http://hl7.org/fhir/StructureDefinition/QuestionnaireResponse" alias QuestionnaireResponse as source  
4 uses "http://hl7.org/fhir/StructureDefinition/Patient" alias Patient as target  
5 |  
6 group QuestionnaireResponse(source src : QuestionnaireResponse, target tgt : Patient) {  
7   src.item as item --> tgt as patient then item(item, patient);  
8 }  
9 |  
10 group item(source src, target tgt: Patient) {  
11   src.item as item where linkId.value in ('patient.sex') --> tgt.gender = (item.answer.valueString);  
12 }  
13 |
```

**Patient Resource Structure (Bottom Right):**

Name	Flags	Card.	Type
Patient	N		DomainResource
identifier	Σ	0..*	Identifier
active	?! Σ	0..1	boolean
name	Σ	0..*	HumanName
telecom	Σ	0..*	ContactPoint
gender	Σ	0..1	code

## FHIR Mapping Example 2

QR.item.item.answer.valueString to  
ExplanationOfBenefit.type

≡ stringtocoding.map M X

tests > ≡ stringtocoding.map

You, now | 1 author (You)

```

1 map "http://ahdis.ch/matchbox/fml/stringtocoding" = "stringtocoding"
2
3 uses "http://hl7.org/fhir/StructureDefinition/QuestionnaireResponse" alias QuestionnaireResponse as source
4 uses "http://hl7.org/fhir/StructureDefinition/ExplanationOfBenefit" alias ExplanationOfBenefit as target
5
6 group stringtocoding(source src : QuestionnaireResponse, target tgt : ExplanationOfBenefit) {
7   src.item as item -> tgt as eob then item(item, eob);
8 }
9
10 group item(source src, target tgt: ExplanationOfBenefit) {
11   src.item as item where linkId.value in ('patient.claim-type') ->
12   tgt.type as code, code.coding as coding, coding.system='http://terminology.hl7.org/CodeSystem/claim-type',
13   coding.code=(item.answer.valueString) "code2coding";
14 }
15

```

Name	Flags	Card.	Type
ExplanationOfBenefit	TU		DomainResource
identifier		0..*	Identifier
status	?! Σ	1..1	code

code	Σ	0..1	code
display	Σ	0..1	string

## Exercise questionnaire response to FHIR resource

Use <https://github.com/ahdis/fhir-mapping-tutorial/tree/master/qr2pat>

Apply the map [map/qr2patgender.map](#) to input [qr.json](#)

1. Apply the transformation with either FHIR Java validator or VSCode/RESTClient/[matchbox](#)
2. Change the mapping that the family name is mapped also from the questionnaire response (item.linkId = 'patient.family') to the Patient resource into the name.family element

*Please change the url of the map if you use VSCode/RESTClient that you have your own map to work on.*

## Solutions

- see branch <https://github.com/ahdis/fhir-mapping-tutorial/tree/devdaysletsbuild>
- diff <https://github.com/ahdis/fhir-mapping-tutorial/compare/devdaysletsbuild?expand=1>

you can run also matchbox locally in a docker container instead of the test server, see  
<https://github.com/ahdis/matchbox> or  
<https://www.matchbox.health/>

*Feedback, Questions?*

## Exercise 1

- Perform the transformation in VSCode with RESTClient yourself for CDA2\_Referto\_di\_Medicina\_di\_Laboratorio.xml and CDA2\_Referto\_Radiologia.xml
- If you want to do changes, please change the map urls or run matchbox locally in docker and change the host to localhost:8080/matchbox and post the Italy maps to it before the transform:

```
docker run --rm -i -t --name matchbox -p 8080:8080 -v /PATH/TO/DIR:/config eu.gcr.io/fhir-ch/matchbox:v220
```

<https://github.com/hl7ch/cda-fhir-maps/tree/hl7italy>

## Exercise 2

setup matchbox running on own docker instance

- Configure PATH/TO/DIR where cda-fhir-maps is checked out (will use application.yaml)
- change the @host in the .http files to <http://localhost:8080/matchbox>
- post the Italy maps to it before invoking the operation

```
docker run --rm -i -t --name matchbox -p  
8080:8080 -v /PATH/TO/DIR:/config  
eu.gcr.io/fhir-ch/matchbox:v220
```

<https://github.com/hl7ch/cda-fhir-maps/tree/hl7italy>

## **Exercise 3**

- map additional sections
- map level3 cda entries

<https://github.com/hl7ch/cda-fhir-maps/tree/hl7italy>

# Agenda

- |               |  |
|---------------|--|
| 10.00 – 10.30 | High Level Introduction CDA and FHIR Mapping (Differences between Standards, FHIR Mapping Language as independent Mapping Exchange format) |
| 10.30 – 11.00 | FHIR Logical Model of CDA - Exercise   |
| 11.15 – 12.15 | FHIR Mapping Language Introduction with conversion to StructureMap - Exercise  |
| 14.00 – 15.00 | CDA to FHIR mapping hands-on with matchbox - Exercise (based on provided Italian example)  |
| 15.00 – 15.30 | Summary, Questions and answers - Exercise  |

## Wrapup / Summary

- CDA and FHIR documents
- FHIR Logical model for CDA
- Validate and convert CDA documents with the FHIR Validator
- Applying FHIRPath expressions to CDA documents
- FHIR Mapping Language: Mapping from CDA to FHIR

## Zulip Streams

- CDA
- CCDA / FHIR mapping stream
- cda to fhir
- cda/publish
- mapping-framework

A screenshot of a Zulip message from the 'mapping-framework' stream. The message was posted by Alexander Zautke on May 13 at 22:11. The message content is: "If anyone is looking for the discussion at the connectathon... See <https://chat.fhir.org/#narrow/stream/179207-connectathon-mgmt/topic/FHIR.20Mapping.20Language.20Track>".
